

Duct/Immersion sensor Temperature

Active sensor (4...20 mA) for measuring temperature in duct applications. In combination with a stainless steel or brass thermowell can also be used for pipe applications. IP65 / NEMA 4X rated enclosure.

## Technical data sheet

	Ambient temperature	-3550°C [-30122°F]
	Fluid temperature	-60320°F [-50160°C]
	Housing surface temperature	max. 160°F [70°C]

#### Safety Notes

This device has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application. Unauthorized modifications are prohibited. The product must not be used in relation with any equipment that in case of a failure may threaten humans, animals or assets.

Ensure all power is disconnected before installing. Do not connect to live/operating equipment.

Only authorized specialists may carry out installation. All applicable legal or institutional installation regulations must be complied during installation.

The device contains electrical and electronic components and must not be disposed of as household refuse. All locally valid regulations and requirements must be observed.

#### Remarks

**General Remarks Concerning Sensors** 

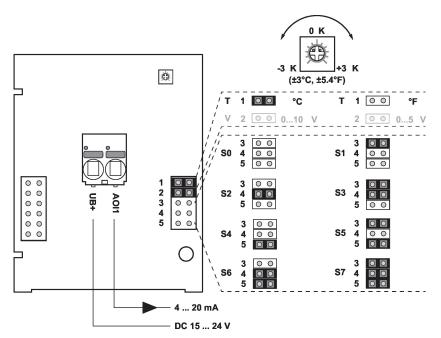

When using lengthy connection wires (depending on the cross section used) the measuring result might be falsified due to a voltage drop at the common GND-wire (caused by the voltage current and the line resistance). In this case, 2 GND-wires must be wired to the sensor - one for supply voltage and one for the measuring current.

Sensing devices with a transducer should always be operated in the middle of the measuring range to avoid deviations at the measuring end points. The ambient temperature of transducer electronics should be kept constant. The transducers must be operated at a constant supply voltage ( $\pm 0.2$  V). When switching the supply voltage on/off, onsite power surges must be avoided.

Build-up of self-heating by electrical dissipative power		
	Transducers 010 V / 420 mA have a standard setting at an operating vo means that at this voltage, the expected measuring error of the output sign For other operating voltages, the offset error will be increased by a changing	ltage of DC 24 V. This nal will be the least.
	sensor electronics. If a readjustment directly at the active sensor should be necessary during l can be done with the following adjustment methods.	ater operation, this
	- For sensors with NFC or dongle with the corresponding Belimo app	
	- For sensors with a trimming potentiometer on the sensor board	
	- For bus sensors via bus interface with a corresponding software variable

The adjustment of the measuring ranges is made by changing the bonding jumpers. The output value in the new measuring range is available after 2 seconds.
