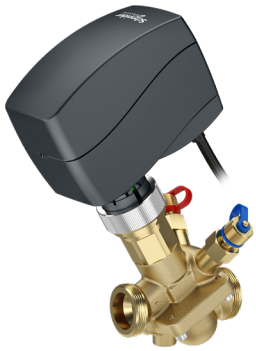
SpaceLogic PIBCV DN10...DN250

Pressure Independent Balancing and Control Valves



Product Description

The **SpaceLogic** PIBCV range is a comprehensive selection of automatic balancing and control valves that provide flow limitation with full control authority over hydronic regulation.

Automatic balancing within PIBCV valves provide stable flow regulation regardless of pressure fluctuations in the system and all valves have an adjustable flow limitation set point. The control valve portion of the PIBCV further regulates the media flow from close-off up to the maximum flow limit setting.

Typical applications are temperature control of chillers, air-handling units, heat exchanges and terminal units such as fan coils, induction units and radiant panels.

Features

- Reduced Energy Consumption
  - Pressure independence ensures no overflow of water/glycol through the valve. Limiting media flow to the design load of the coil has a significant effect on energy efficiency since systems operate for the majority of the time on a partial load where overflow occurs.
  - Overflow of media causes a degradation in ΔT at the heat exchanger. Uncontrolled overflow of media is an extremely wasteful and inefficient use of heat.
  - The correct and maximum design flow ensures a high differential in supply and return temperatures to provide high operational efficiency of the chiller or boiler.
- Improved Comfort
  - The PIBCV valves are not affected by other valves in the system that may be opening and closing throughout the day or other piping system disturbances providing more constant and comfortable room temperature.
- Reduced Pumping Costs
  - A reduction in overflows through the network reduces pumping costs. A smaller pump head and equipment is required compared to traditional configurations.
- Reduced Installation Costs
  - Only one valve needs to be installed rather than two or three since the PIBCV covers the pressure balancing, flow limitation and control modulation.
- Easy and quick Commissioning
  - **SpaceLogic** PIBCV setup time is significantly reduced with a simple and accurate flow setting procedure without the need for flow charts, calculations or measuring equipment.
- Improved Reliability
  - Improved mechanical equipment reliability from reduced actuator movements.

Note: A Higher flow, (Q max) is achievable on some sizes by increasing the pressure drop through the valve, please see technical data starting on page 9.

Accessories

The commissioning label set is a plasticized tag that allows the set flow rate to be recorded and attached to the valve via a cable tie. The handles allow the PIBCV to be used without an actuator as an automatic flow regulation valve, which could be very beneficial in certain networks, especially those closest to the pump that are subject high pressure drops.

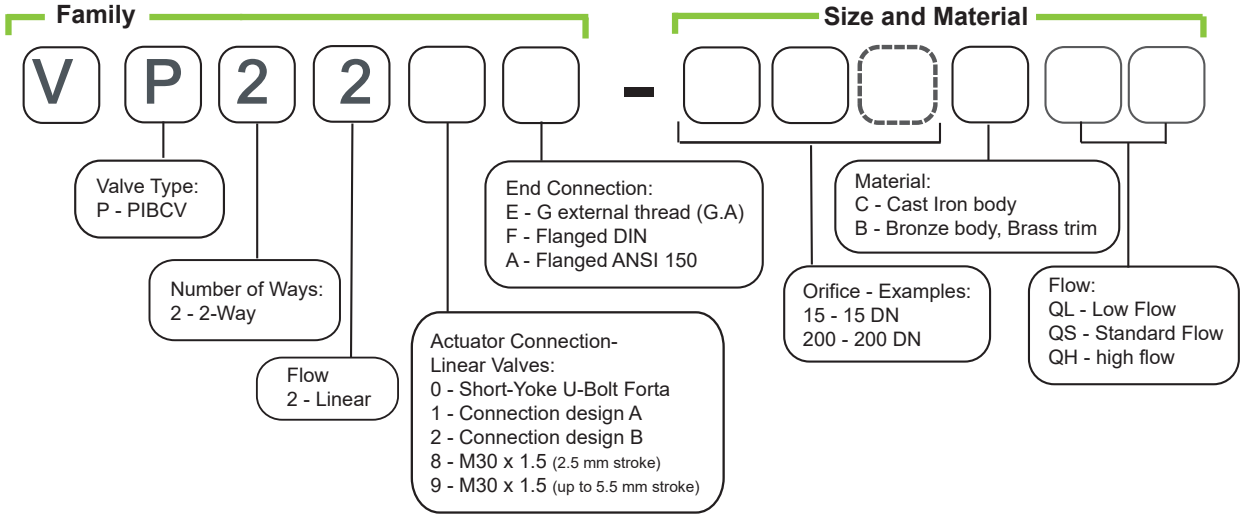
* one piece compact design, additional coupler either side of the valve may be needed to ease assembly / dissasembly

Type Designation Explanation



Implementation Benefits of PIBCV

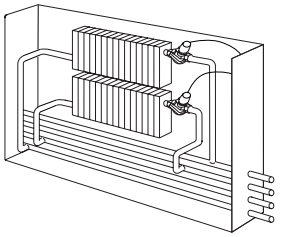
- No Kv or authority calculations needed. Flow is the only parameter to be considered when designing or selecting the **SpaceLogic** PIBCV.
  - The PIBCV always works reliably within the flow range. The maximum setting of the PIBCV corresponds with international standards for flow velocity in pipes.
  - The PIBCV can be used for all HVAC applications and the flow control can be modified from linear to logarithmic when combined with thermal electric or proportional actuators.
  - Compact design, essential when only limited space is available, for example in fan-coil units.
  - Easy commissioning. No specialized staff or measuring equipment needed.
  - Fast start-up. PIBCV valves don't need to be flushed or de-aired before use.
  - Trouble-free segmentation of the building project. The PIBCV will automatically control the flow, even when sections of the installation are still unfinished. It's not needed to re-adjust the PIBCV flow setting after finalization of the building project.

Applications

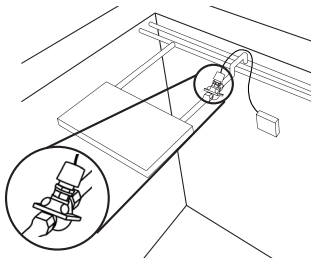
Variable flow systems: The focus application area of the PIBCV is for variable flow systems which includes terminal unit equipment like fan coils (FCU's) and radiation panels as well as larger plant equipment with air handling units (AHU's).

Constant flow systems: The PIBCV can work in numerous constant flow systems, In these applications the PIBCV is installed as an automatic flow limitation valve which may or may not be fitted with an actuator, ensuring the system is automatically balanced with energy efficient control.

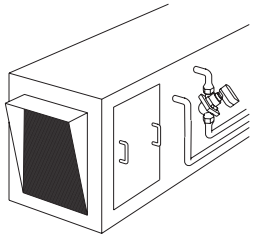
Equipment area's for constant flow systems include radiant panels, fan coils (FCU's) and floor heating.



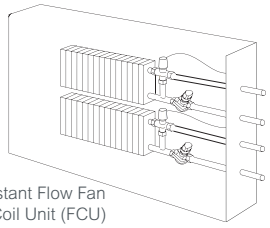
Variable Flow Fan Coil Unit (FCU)



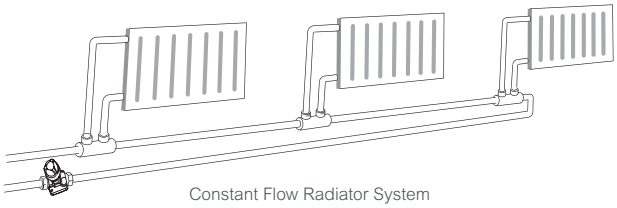
Variable Flow Radiant Panel



Variable Flow Air Handling Unit (AHU)



Constant Flow Fan Coil Unit (FCU)



Constant Flow Radiator System

Control Performance

The **SpaceLogic** PIBCV has a linear control characteristic and is pressure independent which means the control characteristic is independent from the available pressure and is not influenced by a low authority.

The flow limitation on the PIBCV is achieved by limiting the valve stroke. Schneider Electric motoric actuators calibrate to the varying stroke of the valves. This means the PIBCV keeps a predictable linear characteristic independent of the flow setting or differential pressure.

PIBCV actuators electronically adjust the control characteristic from linear to logarithmic (equal percentage) always providing a perfect adaptation regardless of the flow setting. This makes PIBCV suitable for all applications, including AHUs, where the equal percentage characteristic is needed to get a stable control loop. All modulating actuators can be switched from linear to logarithmic by changing a dipswitch setting on Modulating actuators.

The integrated differential pressure controller enables the control valve to have 100 % authority and will always provide stable control. At partial system load there is no resulting overflow downstream to the PIBCV, because the valve will always limit the flow to exactly what it is set to.

By installing the PIBCV the whole system is divided in completely independent control loops. There is a full range of Schneider Electric actuators suitable for every control strategy, including On/Off, 0…10 Volt or 4…20 mA modulating and 3-point floating.

Function

The **SpaceLogic** PIBCV valve consists of two parts:
1. Differential pressure controller
2. Control valve

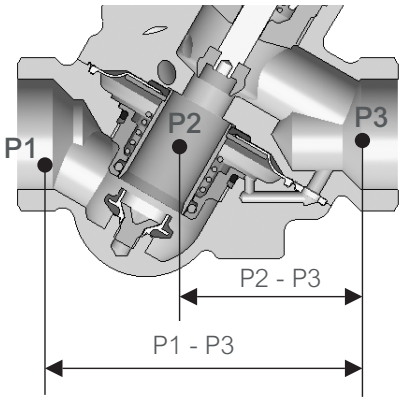
1. Differential Pressure Controller (DPC)

The differential pressure controller maintains a constant differential pressure across the control valve. The pressure difference Δp_{Cv} (P2-P3) on the membrane is balanced with the force of the spring. Whenever the differential pressure across the control valve changes (due to a change in available pressure, or movement of the control valve) the hollow cone is displaced to a new position which brings a new equilibrium and therefore keeps the differential pressure at a constant level.

2. Control Valve (CV)

The control valve has a linear characteristic. It features a stroke limitation function that allows adjustment of the Kv value. The percentage marked on the scale equals the percentage of 100 % flow marked on the pointer. Changing the stroke limitation is done by lifting the blocking mechanism and turning the top of the valve to the desired position, showed on the scale as a percentage. A blocking mechanism automatically prevents unwanted changing of the setting.

SX PIBCV DN10-32



$\Delta p = (P1-P3)$
$\Delta p_{Cv} = (P2-P3)$

PIBCV Flow Presetting

DN10-32

The max flow setting can be adjusted easily without using special tools. To change the presetting of the max flow (factory setting is 100 %) follow the four steps below:

① Remove the grey protective pointer of the mounted actuator.

② Raise the green pointer dial.

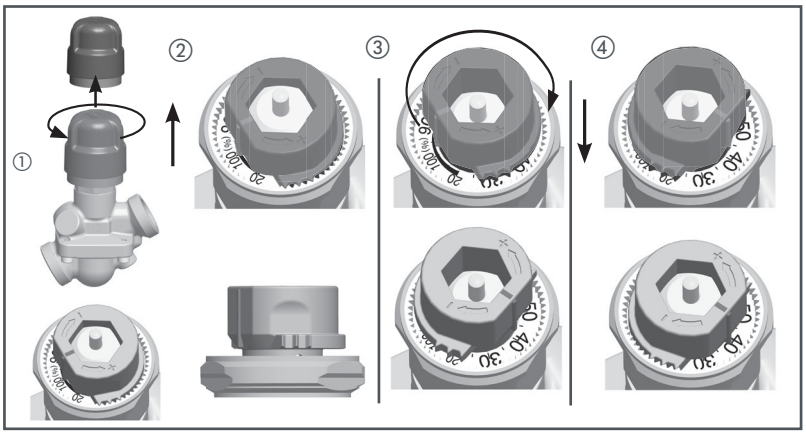
③ Turn (clockwise to decrease) to the new max flow presetting value.

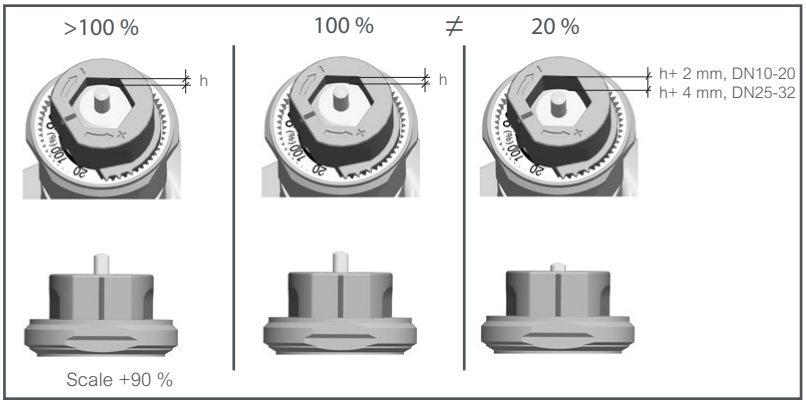
④ Press the dial back into the lock position. After the dial is clicked back into place the max flow presetting value is locked.

The presetting scale indicates values from 100 % flow to 0 %. Clockwise turning would decrease the flow value while counter-clockwise would increase it.

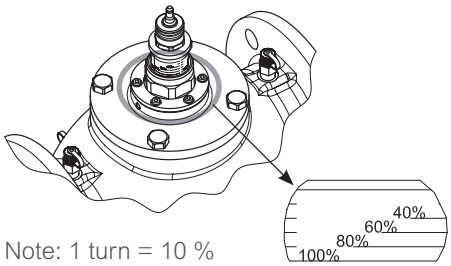
Example:
If the valve is a DN15 then the nom flow = 450 l/h =100 % presetting.
To set a flow of 270 l/h you have to set: 270/450 = 60 %.
Schneider Electric recommends a presetting/flow from 20 % to 100 %. Factory presetting is 100 %.
The DN10-32 valves can be set to a Qmax flow which is a setting above the Qnom setting of 100%. Table 4 details the Qmax setting which is either limited to 110% or 120%.
The maximum reading on the scale is 100%; to adjust the flow setting beyond 100% the pointer will be adjusted counter-clockwise past the max scale setting.

The flow setting above the Qnom is the readable value + 90%. Thus in this zone the pointer at 20% position will be a flow setting of 110% and at the 30% position the flow setting will be 120%.

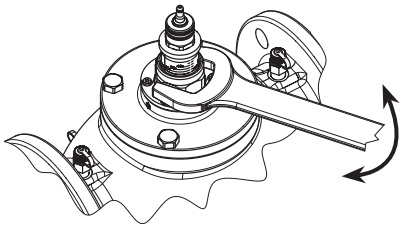




DN40-100

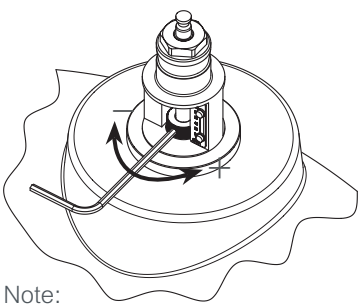


Note: 1 turn = 10 %

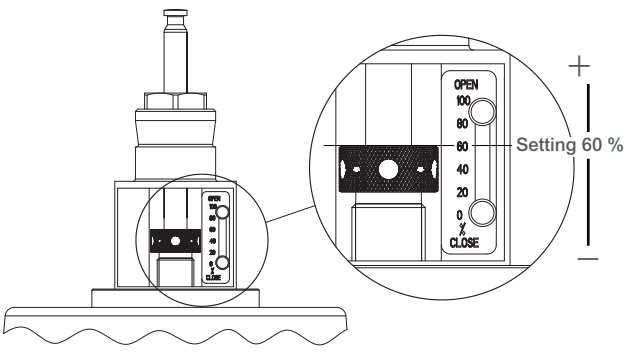


Max 25Nm

DN125-250



Note:
DN125 & 150: 1 turn = 5.0 %
DN200 & 250: 1 turn = 5.5 %

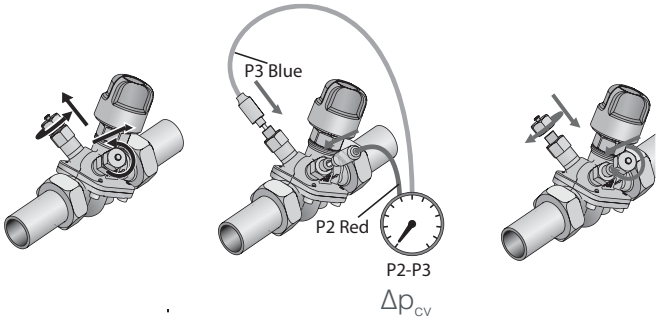


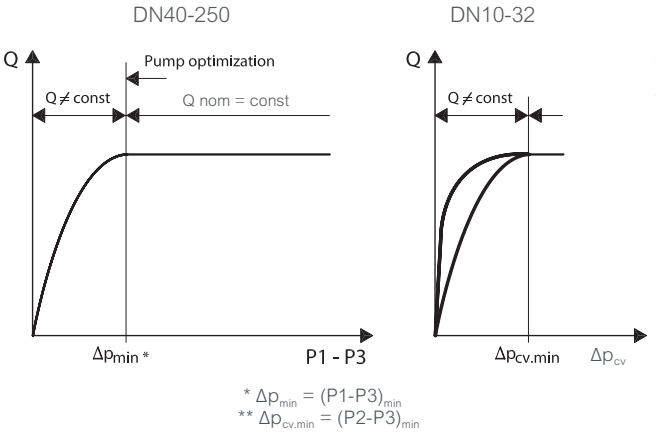
Pump Optimizing / Troubleshooting

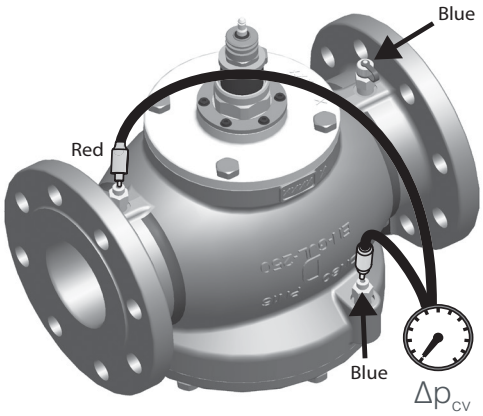
The DN10-100 PIBCV valves feature test plugs that allow measuring of the pressure difference Δpcv (P2 to P3) across the control valve. With the DN40-250 PIBCV valves the measuring can also be done between P1 to P3. If the operating pressure differential exceeds the minimum required pressure differential as detailed in the technical tables, flow limitation to the set point will be achieved. The measuring function of the test ports can be used to verify if enough operating pressure differential is available and thus verify the flow or measure the flow directly.

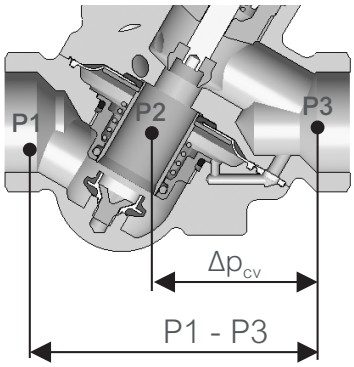
The P1 test plug can also be used to optimize the pump head. The pump head can be decreased until no more than the minimal required pressure is available on the most critical valve (in terms of hydronic). As the P1 test plug is not possible on the DN10-32 valves, a separate pressure taping for the critical index circuit should be made available for this measurement.

Verifying the pressure can be done by using traditional or electronic manometers.









Service Shut Off

DN10-32

For the service shut off function, it is recommended to install the valve in the supply water pipe. Valves are equipped with plastic shut-off mechanism that is to be used for isolating function up to 1 bar differential pressure.

DN40-100

For the service shut off function, the valve can be installed in either supply or return pipe. Valves are equipped with manual shut-off for isolating function up to 16 bar.

Flow Direction

PIBCV valves are mono-directional, meaning the valve operates when the arrow on the valve body is aligned with the flow direction. When this rule is ignored the valve acts like a variable orifice that causes water hammer at sudden closing when available pressure has increased or the valve has been set to a lower value. In the case when a system condition allows backflows, it is strongly recommended to use a backflow preventer in order to avoid possible water hammer that can damage to the valve as well as other elements in the system.

It is recommended to fit a strainer upstream of the valve to increase reliability and to follow water treatment guidelines as detailed in VDI 2035.

The pipework system should be flushed prior to the operation.

1) Factory setting of the valve is done at nominal setting range.
2) Regardless of the setting, the valve can modulate below 1 % of set flow.
3) Δp = (P1–P3) min~max
4) When set above 100 %, minimum starting pressure needed is higher, see figures in the ().
5) For Δp above 400 kPa, static pressure (P1) must be greater than 2 x Δp.

For suitability and usage in non-oxygen tight systems please observe instructions of the coolant producer.

Pc - pressure controller part Cv - Control valve part

Note: Media Compatibility

It is the responsibility of the installer or product specifier to verify media compatibility of the valves construction materials with the supplier of water treatment/heat transfer solution.

Filtration

Strainers should always be fitted upstream of the valve.

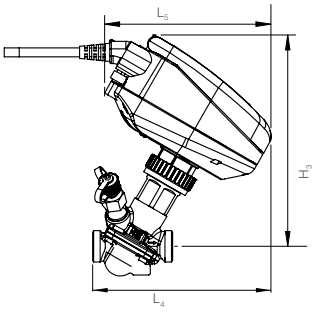
With MP300-SR Actuator

Table 7. Threaded Valves DN10…DN32

Type	L_1	L_2	L_4				H_1	H_2	H_3				b (ISO 228/1)	Valve weight (kg)
			SP90	MP120	MP130	MP300-SR			SP90	MP120	MP130	MP300-SR		
DN10	53	36	118	101	111	130	74	20	140	120	143	185	G½A	0.38
DN15	65	45	125	108	118	137	77	25	143	123	145	188	G¾A	0.48
DN20	82	56	133	117	127	146	79	31	145	125	148	190	G 1A	0.65
DN25	104	71	148	132	142	160	88	40	153	133	156	199	G 1¼A	1.45
DN32	130	90	166	149	160	178	99	49	164	144	167	210	G 1½A	2.21

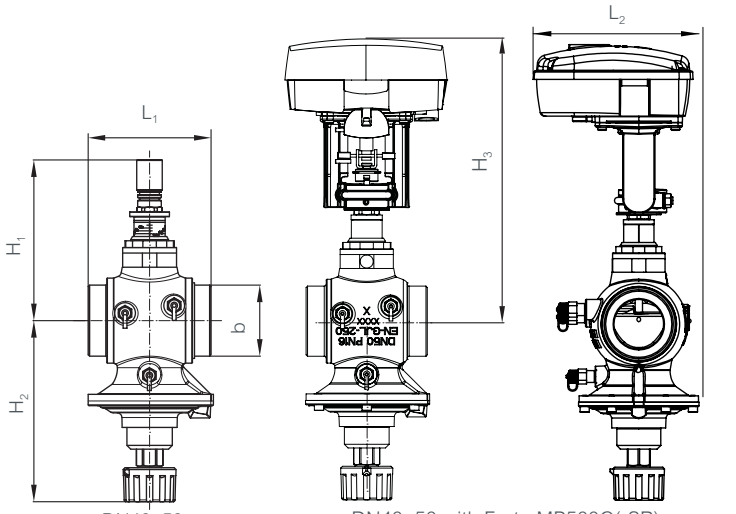


With SP90 Actuator

L^3 (plugs): 79
L^5: MP130: 104; MP300: 146; SP90: 110.21.

Table 8. Threaded Valves DN40, DN50 (mm)

Type	L_1	L_2	H_1	H_2	H_3		b (ISO 228/1)	Wght (kg)
					MP500C	MP500C-SR		
DN40	110	143	170	174	302	305	G 2A	6.9
DN50	130	181	170	174	302	305	G 2½A	7.8

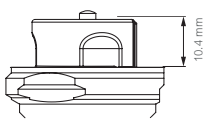


DN40, 50

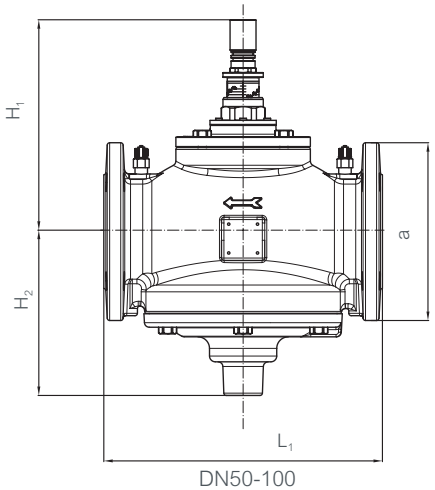
DN40, 50 with Forta MP500C(-SR)

Table 9. Flanged Valves DN50-DN100 (mm)

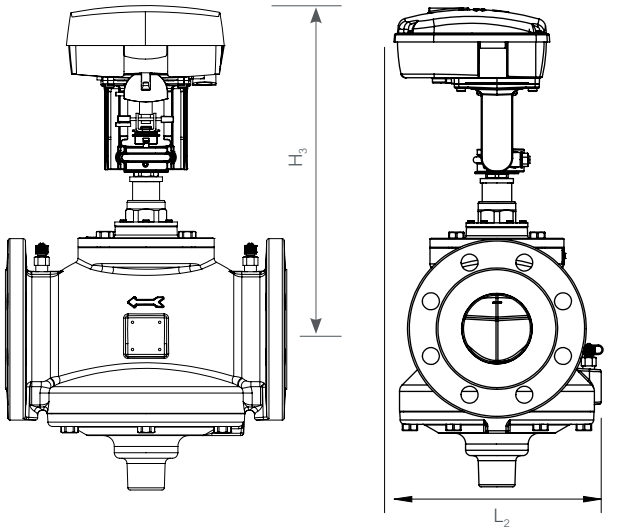
Type	L_1	L_2	H_1	H_2	H_3		a (EN 1092-2)	Wght (kg)
					MP500	MP500C-SR		
DN50	230	198	170	174	302	305	165	14.2
DN65	290	223	220	172	351	354	185	38.0
DN80	310	232	225	177	356	359	200	45.0
DN100	350	256	240	187	372	375	220	57.0



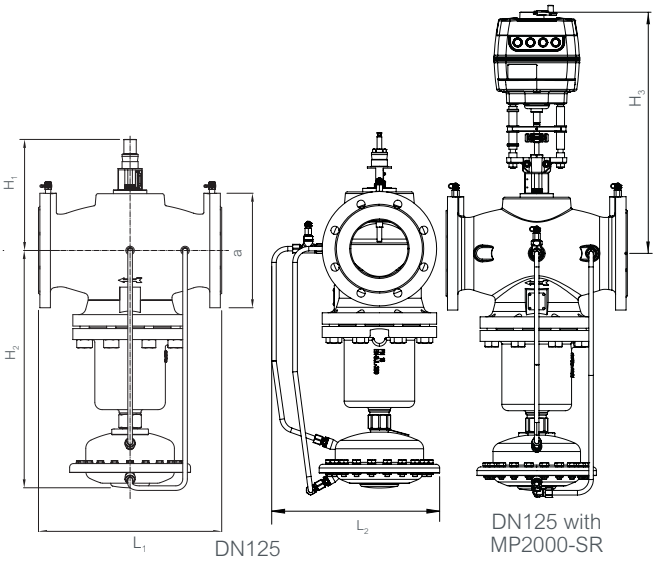
Closing point (measure for DN10-32)



DN50-100

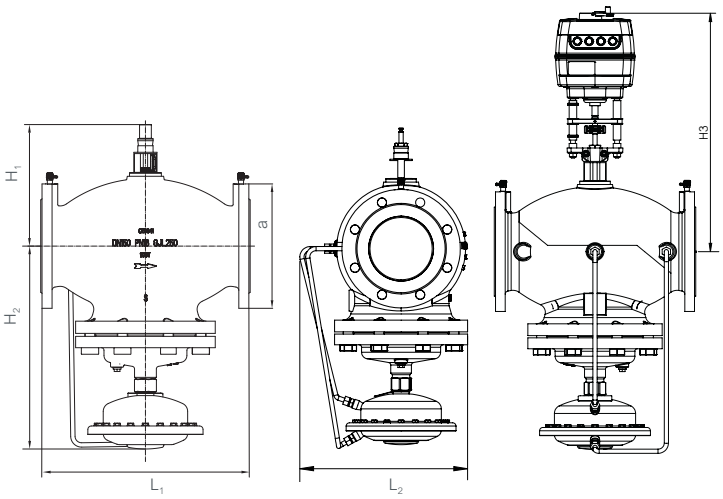


DN50-100 with Forta MP500C(-SR)



DN125

DN125 with MP2000-SR

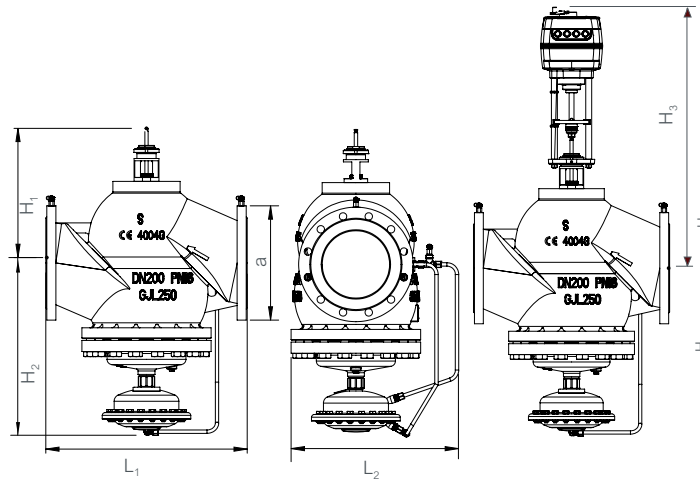


DN150

DN150 with MP2000-SR

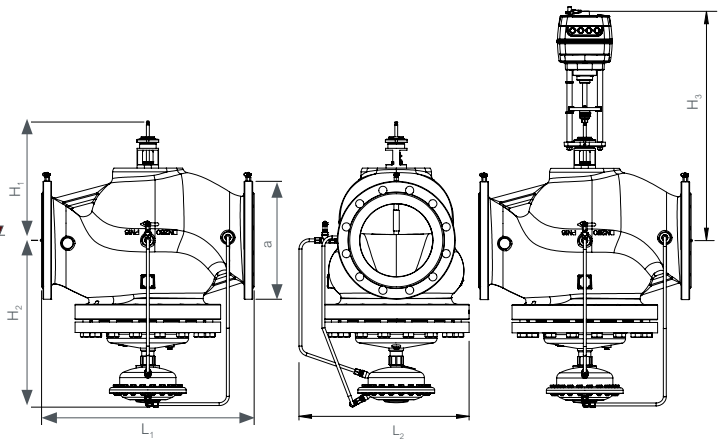
Table 10. Flanged DN125, DN150

Size	L_1	L_2	H_1	H_2	H_3		a (EN 1092-2)	Weight (kg)
					MP2000	MP2000-SR		
DN125	400	367	272	518	511	532	250	85.3
DN150	480	403	290	481	547	568	285	138



DN200

DN200 with MP4000



DN250

DN250 with MP4000

Table 11. Flanged DN200, DN250

Size	L_1	L_2	H_1	H_2	H_3	a (EN 1092-2)	Weight (kg)
					MP4000		
DN200	600	497	434	483	783	340	219
DN250	730	584	406	573	788	405	342
